

## How Does The Treated Water Compare To The Raw Water?

SUVA stands for Specific Ultra Violet Absorbance. SUVA and DOC (Dissolved Organic Carbon) may be important in regards to the Disinfectants/Disinfection By-Product Rule because they are an indicator of naturally occurring organic matter. SUVA is calculated using the Absorbance of light in water at 254 nanometers and the DOC analysis result. The removal of SUVA and DOC in the treatment process is key to ensuring thorough disinfection. Therefore, the averages for the raw (influent) water are included with the treated (effluent) water.

**SUVA for Marston Influent and Effluent for 2001**

**SUVA for Foothills Influent and Effluent for 2001**

**SUVA for Moffat Influent and Effluent for 2001**
